

FORK SPREADER

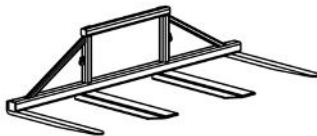

SAFETY & STABILITY IN WIDE LOADS

Arrow Fork Spreaders are used to evenly distribute the weight of long or bulky loads, reducing the risk of damage to goods and equipment. By extending the reach of the forklift, Fork Spreaders improve load stability and handling, making them ideal for industries dealing with large, unwieldy materials such as lumber, pipes, and metal sheets. Their robust construction and easy installation ensure reliable performance and durability, ultimately increasing productivity and workplace safety. Standard widths up to 24 feet.

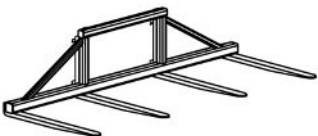

"Stirrup" type

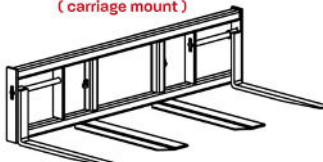

Fixed (w/ pockets)

Fixed (carriage mount)

Adjustable (carriage mount)

Options

- » **Fixed** outer forks are welded in place at desired width
- » **Adjustable** outer forks hang on a shaft bar and can slide on the shaft bar to adjust the outer fork width
- » **Pocket Style Spreader** is built with tubed pockets in which are lifted by the existing forks on the machine
- » **Coupler Style Spreader** is fitted with coupler welded to the back of the spreader which mounts directly to your machine
- » **Carriage Mount Spreader** is fitted with ITA hooks welded to top and bottom, ITA hooks will allow spreader to hang directly on the carriage of the forklift
